Assignment - Install Anaconda with Machine Learning packages
Cognitive Systems for Health Technology Applications, Spring 2018

Downloading the Anaconda Python package went well, and I had no problems with that. The problems started when I tried to install the keras package. Anaconda Prompt gave the following error message.

CondaIOError: Missing write permissions in: C:\ProgramData\Anaconda3
#
 # You don't appear to have the necessary permissions to install packages
 # into the install area 'C:\ProgramData\Anaconda3'.
 # However you can clone this environment into your home directory and
 # then make changes to it.
 # This may be done using the command:
#
 # $ conda create -n my_root --clone="C:\ProgramData\Anaconda3"

I sent an email to Sakari Lukkarinen asking for help with that. He answered that the problem probably is that Anaconda is installed with Admin privileges and then you try to install other packages as normal user. And as the matter of fact, that was the case in my situation. I fixed the problem by running the prompt file as administrator like Sakke suggested and now everything works fine.
